```python
def celsius_to_fahrenheit(celsius):
    fahrenheit = (celsius * 9/5) + 32
    return fahrenheit

def meters_to_feet(meters):
    feet = meters * 3.28084
    return feet

def kg_to_pounds(kilograms):
    pounds = kilograms * 2.20462
    return pounds

# Example usage:
temperature_celsius = float(input("Enter temperature in Celsius: "))
temperature_fahrenheit = celsius_to_fahrenheit(temperature_celsius)
print(f"{temperature_celsius} Celsius is equal to {temperature_fahrenheit} Fahrenheit.")

length_meters = float(input("Enter length in meters: "))
length_feet = meters_to_feet(length_meters)
print(f"{length_meters} meters is equal to {length_feet} feet.")

weight_kg = float(input("Enter weight in kilograms: "))
weight_pounds = kg_to_pounds(weight_kg)
print(f"{weight_kg} kilograms is equal to {weight_pounds} pounds.")
```
